## Project-quiz.php

This part of the project is used to display our questions to the viewer of the page. We use PHP to get the data that's been stocked in the project database which is used to display all sorts of information for some swimmers like which technique they used, how many prizes they won, how fast they swim, etc. This part is just to interact with our viewers and make them learn a bit more about the swimmers we're talking about through some fun little quiz about them. In this file there's some CSS which helps to make the page more attractive to the eye, like making some of the text white to blend in with the background, or the language button which is used to convert the text to English or, vice versa, back to French. Lastly, we used a combination of different HTML attributes such as `<select>`, which is used to do a drop-down list, `<script>` to use some JSON which we can use to do different things like listen to the click of a button, make the drop-down list actually work, or with PHP get the data that is necessary to display the swimmers' info like I said earlier.
