Introduction 0

View - Index.html

This file is mainly the home page of our site. We have our introduction, and you can navigate to any of the other sections like the quiz, the technologies, the biographies, or the events. This file uses CSS, HTML, and JSON but doesn't use PHP since we don't really have to reach some data because it just contains the introduction. The HTML used in this section contains some basic HTML attributes like img used for our banner, the <main> which is used to put our introduction in, some <style> for the CSS which I'll explain what we do with in a bit, <h2> to make our text a bit bigger but is used more for the style, and the <script> which is used here to translate the text in the introduction with the help of some JSON coding. The CSS here is basic too. We have the navigation bar which uses a combination of background coloring, text-alignment, display, and margin to make it look professional and nice to the eye because CSS is, after all, just to make sites look better. Finally, our JSON isn't too complicated. It is simply a script which uses a variable to listen to when someone clicks on the button to translate to say "hey, we just got clicked on, translate the text to English," which is simply the text we translated into French that we put in another variable and change the text content of the introduction text section.
